# Advice for applying machine learning

---

## Deciding what to try next

## Debugging a learning algorithm:

Suppose you have implemented regularized linear regression to predict housing prices.

$$\rightarrow J(\theta) = \frac{1}{2m} \left[ \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \lambda \sum_{j=1}^m \theta_j^2 \right]$$

However, when you test your hypothesis on a new set of houses, you find that it makes unacceptably large errors in its predictions. What should you try next?

- $\rightarrow$  - Get more training examples
- Try smaller sets of features  $x_1, x_2, x_3, \dots, x_{100}$
- $\rightarrow$  - Try getting additional features
- Try adding polynomial features ( $x_1^2$ ,  $x_2^2$ ,  $x_1 x_2$ , etc.)
- Try decreasing  $\lambda$
- Try increasing  $\lambda$

## Machine learning diagnostic:

**Diagnostic:** A test that you can run to gain insight what is/Isn't working with a learning algorithm, and gain guidance as to how best to improve its performance.

Diagnostics can take time to implement, but doing so can be a very good use of your time.

## Evaluating a hypothesis

# Evaluating your hypothesis

→ 
$$h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$$

Fails to generalize to new examples not in training set.

$x_1$  = size of house

$x_2$  = no. of bedrooms

$x_3$  = no. of floors

$x_4$  = age of house

$x_5$  = average income in neighborhood

$x_6$  = kitchen size

$\vdots$

$x_{100}$

# Evaluating your hypothesis

Dataset:

|       | Size | Price |
|-------|------|-------|
| 70%   | 2104 | 400   |
|       | 1600 | 330   |
|       | 2400 | 369   |
|       | 1416 | 232   |
|       | 3000 | 540   |
|       | 1985 | 300   |
|       | 1534 | 315   |
| <hr/> |      |       |
| 30%   | 1427 | 199   |
|       | 1380 | 212   |
|       | 1494 | 243   |

Training set

$$\begin{pmatrix} x^{(1)}, y^{(1)} \\ x^{(2)}, y^{(2)} \\ \vdots \\ x^{(m)}, y^{(m)} \end{pmatrix}$$

$$\begin{pmatrix} x_{test}^{(1)}, y_{test}^{(1)} \\ x_{test}^{(2)}, y_{test}^{(2)} \\ \vdots \\ x_{test}^{(m_{test})}, y_{test}^{(m_{test})} \end{pmatrix}$$

$m_{test} = \text{no. of test example}$   
 $(x_{test}^{(i)}, y_{test}^{(i)})$

# Training/testing procedure for linear regression

→ - Learn parameter  $\theta$  from training data (minimizing training error  $J(\theta)$ ) 70%

- Compute test set error:

$$J_{\text{test}}(\theta) = \frac{1}{2m_{\text{test}}} \sum_{i=1}^{m_{\text{test}}} \left( \frac{h_{\theta}(x_{\text{test}}^{(i)}) - y_{\text{test}}^{(i)}}{1} \right)^2$$

## Training/testing procedure for logistic regression

- Learn parameter  $\theta$  from training data
- Compute test set error:

$$J_{test}(\theta) = -\frac{1}{m_{test}} \sum_{i=1}^{m_{test}} y_{test}^{(i)} \log h_{\theta}(x_{test}^{(i)}) + (1 - y_{test}^{(i)}) \log h_{\theta}(x_{test}^{(i)})$$

- Misclassification error (0/1 misclassification error):

Machine Learning

# Advice for applying machine learning

Model selection and  
training/validation/test  
sets

## Overfitting example

$$h_{\theta}(x) = \underbrace{\theta_0} + \underbrace{\theta_1}x + \underbrace{\theta_2}x^2 + \theta_3x^3 + \theta_4x^4$$

Once parameters  $\theta_0, \theta_1, \dots, \theta_4$  were fit to some set of data (training set), the error of the parameters as measured on that data (the training error  $J(\theta)$ ) is likely to be lower than the actual generalization error.

→  $d = \text{degree of polynomial}$  ↓

## Model selection

$d=1$  1.  $\rightarrow h_{\theta}(x) = \theta_0 + \theta_1 x \rightarrow \Theta^{(1)} \rightarrow J_{\text{test}}(\Theta^{(1)})$

$d=2$  2.  $\rightarrow h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 \rightarrow \Theta^{(2)} \rightarrow J_{\text{test}}(\Theta^{(2)})$

$d=3$  3.  $\rightarrow h_{\theta}(x) = \theta_0 + \theta_1 x + \dots + \theta_3 x^3 \rightarrow \Theta^{(3)} \rightarrow J_{\text{test}}(\Theta^{(3)})$

⋮

⋮

⋮

$d=10$  10.  $\rightarrow h_{\theta}(x) = \theta_0 + \theta_1 x + \dots + \theta_{10} x^{10} \rightarrow \Theta^{(10)} \rightarrow J_{\text{test}}(\Theta^{(10)})$

Choose  $\theta_0 + \dots + \theta_5 x^5 \leftarrow$

How well does the model generalize? Report test set error  $J_{\text{test}}(\theta^{(5)})$ .

$\Theta^{(5)}$

$\Theta_0, \Theta_1, \dots$  ↑

**Problem:**  $J_{\text{test}}(\theta^{(5)})$  is likely to be an optimistic estimate of generalization error. I.e. our extra parameter ( $\underline{d}$  = degree of polynomial) is fit to test set.

Pick  $\theta_0 + \theta_1 x + \dots + \theta_4 x^4 \leftarrow$

Estimate generalization error for test set  $J_{test}(\theta^{(4)})$   $\leftarrow$

Machine Learning

# Advice for applying machine learning

---

## Diagnosing bias vs. variance

# Bias/variance

High bias  
(underfit)  
 $d=1$

“Just right”  
 $d=2$

High variance  
(overfit)  
 $d=4$

# Bias/variance

Training error:  $J_{train}(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$

Cross validation error:  $J_{cv}(\theta) = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_{\theta}(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$  (or  $J_{test}(\theta)$ )

## Diagnosing bias vs. variance

Suppose your learning algorithm is performing less well than you were hoping. ( $J_{cv}(\theta)$  or  $J_{test}(\theta)$  is high.) Is it a bias problem or a variance problem?

Bias (underfit):

$$\rightarrow \left. \begin{array}{l} J_{train}(\theta) \text{ will be high} \\ J_{cv}(\theta) \approx J_{train}(\theta) \end{array} \right\}$$

Variance (overfit):

$$\rightarrow \left. \begin{array}{l} J_{train}(\theta) \text{ will be low} \\ J_{cv}(\theta) \gg J_{train}(\theta) \end{array} \right\}$$

$\Rightarrow$

Machine Learning

# Advice for applying machine learning

---

## Regularization and bias/variance

# Linear regression with regularization

Model:  $h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$

$$J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \frac{\lambda}{2m} \sum_{j=1}^m \theta_j^2$$

Large  $\lambda$

→ High bias (underfit)

→  $\lambda = 10000$ .  $\theta_1 \approx 0, \theta_2 \approx 0, \dots$   
 $h_{\theta}(x) \approx \theta_0$

Intermediate  $\lambda$

“Just right”

→ Small  $\lambda$

High variance (overfit)

→  $\lambda = 0$

## Choosing the regularization parameter $\lambda$

$$h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4 \quad \leftarrow$$

$$J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \frac{\lambda}{2m} \sum_{j=1}^m \theta_j^2 \quad \leftarrow$$

$$\rightarrow J_{train}(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

$$J_{cv}(\theta) = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_{\theta}(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$$

$$J_{test}(\theta) = \frac{1}{2m_{test}} \sum_{i=1}^{m_{test}} (h_{\theta}(x_{test}^{(i)}) - y_{test}^{(i)})^2$$

$J(\theta)$

$J_{train}$   
 $J_{cv}$   
 $J_{test}$

## Choosing the regularization parameter $\lambda$

Model:  $h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$

$$J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \frac{\lambda}{2m} \sum_{j=1}^m \theta_j^2$$

1. Try  $\lambda = 0 \leftarrow \uparrow \rightarrow \min_{\theta} J(\theta) \rightarrow \theta^{(1)} \rightarrow J_w(\theta^{(1)})$
2. Try  $\lambda = 0.01$   $\rightarrow \min_{\theta} J(\theta) \rightarrow \theta^{(2)} \rightarrow J_w(\theta^{(2)})$
3. Try  $\lambda = 0.02$   $\rightarrow \theta^{(3)} \rightarrow J_w(\theta^{(3)})$
4. Try  $\lambda = 0.04$   $\vdots$
5. Try  $\lambda = 0.08$   $\rightarrow \theta^{(5)} \rightarrow J_w(\theta^{(5)})$
- $\vdots$
12. Try  $\lambda = 10$   $\rightarrow \theta^{(12)} \rightarrow J_w(\theta^{(12)})$
- $\uparrow$  10.24
- Pick (say)  $\theta^{(5)}$ . Test error:  $J_{\text{test}}(\theta^{(5)})$

# Bias/variance as a function of the regularization parameter $\lambda$

$$\rightarrow J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \boxed{\frac{\lambda}{2m} \sum_{i=1}^m \theta_j^2}$$

$$\rightarrow \underline{J_{train}(\theta)} = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

$$\rightarrow \boxed{J_{cv}(\theta)} = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_{\theta}(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$$

Machine Learning

# Advice for applying machine learning

---

## Learning curves

# Learning curves

$$\rightarrow \underline{J_{train}(\theta)} = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 \leftarrow$$

$$\rightarrow J_{cv}(\theta) = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_{\theta}(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$$

$$h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2$$

## High bias

If a learning algorithm is suffering from high bias, getting more training data will not (by itself) help much. 💬

## High variance

If a learning algorithm is suffering from high variance, getting more training data is likely to help.  $\leftarrow$

$$h_{\theta}(x) = \theta_0 + \theta_1 x + \dots + \theta_{100} x^{100}$$

(and small  $\lambda$ )  $\nwarrow$

Machine Learning

# Advice for applying machine learning

---

## Deciding what to try next (revisited)

## Debugging a learning algorithm:

Suppose you have implemented regularized linear regression to predict housing prices. However, when you test your hypothesis in a new set of houses, you find that it makes unacceptably large errors in its prediction. What should you try next?

- Get more training examples → fixes high variance
- Try smaller sets of features → fixes high variance
- Try getting additional features → fixes high bias
- Try adding polynomial features ( $x_1^2, x_2^2, x_1x_2$ , etc) → fixes high bias.
- Try decreasing  $\lambda$  → fixes high bias
- Try increasing  $\lambda$  → fixes high variance

# Neural networks and overfitting

→ “Small” neural network  
(fewer parameters; more  
prone to underfitting)

Computationally cheaper

→ “Large” neural network  
(more parameters; more prone  
to overfitting)

Computationally more expensive.

Use regularization ( $\lambda$ ) to address overfitting.

$J_{co}(\theta)$  ↑
